Functional Pathway Enrichment Across Network Modules
GO BP
KEGG
proteasome−mediated ubiquitin−dependent protein catabolic process
Ubiquitin mediated proteolysis
Parkinson disease
cell cycle phase transition
Proteasome
protein polyubiquitination
phospholipid biosynthetic process
N−Glycan biosynthesis
Glycosylphosphatidylinositol (GPI)−anchor biosynthesis
glycolipid biosynthetic process
GPI anchor biosynthetic process
Various types of N−glycan biosynthesis
vesicle−mediated transport in synapse
mTOR signaling pathway
Dopaminergic synapse
modulation of chemical synaptic transmission
Cholinergic synapse
TOR signaling
DNA−templated transcription initiation
regulation of DNA repair
ATP−dependent chromatin remodeling
Nucleotide excision repair
nucleotide−excision repair
Base excision repair
vesicle−mediated transport in synapse
neurotransmitter transport
vesicle fusion
Synaptic vesicle cycle
GABAergic synapse
Nicotine addiction
ATP−dependent chromatin remodeling
epigenetic regulation of gene expression
double−strand break repair
protein−DNA complex organization
Basal transcription factors
Cadherin signaling
Hippo signaling pathway
Hippo signaling pathway − multiple species
hippo signaling
cell−cell junction organization
maintenance of blood−brain barrier
NOD−like receptor signaling pathway
NF−kappa B signaling pathway
canonical NF−kappaB signal transduction
cellular response to biotic stimulus
TNF signaling pathway
endolysosomal toll−like receptor signaling pathway
Integrin signaling
Focal adhesion
ECM−receptor interaction
response to wounding
positive regulation of cell migration
integrin−mediated signaling pathway
PI3K−Akt signaling pathway
JAK−STAT signaling pathway
cytokine−mediated signaling pathway
Cytokine−cytokine receptor interaction
peptidyl−tyrosine phosphorylation
cell surface receptor signaling pathway via JAK−STAT
